TI **IFN**-alpha induces early lethal lupus in preautoimmune (New Zealand Black x New Zealand White) F1 but not in BALB/c mice.
AU Mathian Alexis; Weinberg Arthur; Gallegos Mike; **Banchereau Jacques**; Koutouzov Sophie
AB Recent studies indicate that **IFN**-alpha is involved in pathogenesis of systemic lupus erythematosus. However, direct proof that **IFN**-alpha is not only necessary, but also sufficient to induce lupus pathogenicity is lacking. In this study, we show that in vivo adenovector-mediated delivery of murine **IFN**-alpha results in preautoimmune (New Zealand Black (NZB) x New Zealand White (NZW))F(1), but not in normal, mice, in a rapid. . . severe disease with all characteristics of systemic lupus erythematosus. Anti-dsDNA Abs appeared as soon as day 10 after initiation of **IFN**-alpha **treatment**. Proteinuria and death caused by glomerulonephritis occurred in all treated mice within, respectively, approximately 9 and approximately 18 wk, at a time when all untreated (NZB x NZW)F(1) did not show any sign of disease. **IFN**-alpha in vivo induced an overexpression of B lymphocyte stimulator in circulation at similar levels in both the preautoimmune and the normal mouse strains. All effects elicited by **IFN**-alpha were dose dependent. (NZB x NZW)F(1) infused with purified murine **IFN**-alpha also showed acceleration of lupus. Thus, prolonged expression of **IFN**-alpha in vivo induces early lethal lupus in susceptible animals.

TI Interleukin-12- and gamma interferon-dependent innate immunity are essential and sufficient for long-term survival of passively immunized mice infected with herpes simplex virus type 1
AU Vollstedt, Sabine; Franchini, Marco; Alber, Gottfried; Ackermann, Mathias; Suter, Mark
SO Journal of Virology (2001), 75(20), 9596-9600
CODEN: JOVIAM; ISSN: 0022-538X
PY 2001
AB **Interferon** (IFN) **type I** (α/β IFN) is very important in directly controlling herpes simplex virus type 1 (HSV-1) replication as well as in guiding and upregulating specific immunity against this virus. By contrast, the roles of IFN type II (IFN-γ) and **antibodies** in the defense against HSV-1 are not clear. Mice without a functional IFN system and no mature B and T cells (AGR mice) did not survive HSV-1 infection in the presence or absence of neutralizing **antibodies** to the virus. Mice without a functional IFN type I system and with no mature B and T cells (AR129. . . with as little as 10 PFU of HSV-1 strain F. By contrast, in the presence of passively administered neutralizing murine **antibodies** to HSV-1, some AR129 mice survived infection with up to 104 PFU of HSV-1. This acute immune response was dependent on the presence of interleukin-12 (IL-12) p75. Interestingly, some virus-infected mice stayed healthy for several months, at which time **antibody** to HSV-1 was no longer detectable. **Treatment** of these virus-exposed mice with dexamethasone led to death in approx. 40% of the mice. HSV-1 was found in brains of mice that did not survive dexamethasone **treatment**, whereas HSV-1 was absent in those that survived the **treatment**. Thus, in the presence of passively administered HSV-1-specific **antibodies**, the IL-12-induced IFN-γ-dependent innate immune response is able to control low doses of virus infection. Surprisingly, in a proportion of these mice, HSV-1 appears to persist in the absence of **antibodies** and specific immunity.

TI Effect of virus-induced interferon on the antibody response of suckling and adult mice.
AU Vignaux F; Gresser I; Fridman W H
SO European journal of immunology, (1980 Oct) Vol. 10, No. 10, pp. 767-72.
Journal code: 1273201. ISSN: 0014-2980.
PY 1980
AB Continued administration of potent virally induced mouse **interferon** (IFN **type I**) preparations to suckling mice resulted in an inhibition of the primary **antibody** response to sheep erythrocytes (14-day-old mice). When slightly older suckling mice were immunized (17 days old), a delay (about 2. . . the response was similar in both control and IFN-treated animals. In adult mice, potent IFN preparations did not inhibit the **antibody** response under a variety of experimental conditions (different doses of IFN, schedules of **treatment**, routes of injection, times of assay). Although IFN does inhibit the in vitro **antibody** response, we conclude that under most experimental conditions, injection of IFN type I is not immunosuppressive in adult mice. When administered after immunization, IFN clearly enhanced the primary **antibody** response. It is of interest that IFN, a product of viral infection, enhances in vivo those components of the immune. . . delayed-type hypersensitivity, natural killer cell and macrophage activity, expression of lymphocyte membrane molecules), and, as is shown here, the primary **antibody** response.
